Upgrading from Asterisk at Home or TrixBos

Note: You may need to install subversion for your linux distribution if you have any errors.

Upgrading to a 'Released' version
Currently, the latest release is 2.1.3.

Using Subversion(Preferred)

```
cd /usr/src/
svn co
https://svn.sourceforge.net/svnroot/amportal/freepbx/tag
freepbx-2.1.3
```

or, you can download the files from sourceforge.

```
wget
http://easynews.dl.sourceforge.net/sourceforge/amportal/
2.1.3.tgz
tar xzf freepbx-2.1.3.tgz
```

Installing the New Files

```
cd freepbx-2.1.3
./install_amp
```

If you're upgrading from Asterisk at Home read the "Recovering Lost Modules" section below. If you're using Trixbos, or upgrading from a previous version of FreePBX or AMP, you're done!

Upgrading to the current development code ('SVN')

Getting the Files

```
cd /usr/src/
rm -rf freepbx
svn co
https://svn.sourceforge.net/svnroot/amportal/freepbx/trunk
freepbx
```

Note, this code is under active development, and may be totally broken. However, there's usually new things in SVN that you may want to play with. Also, when you're using SVN, you must specify the last 'released' version you were using. This ensures that the database layout is

up to date. You do this with the command:

```
cd /usr/src/freepbx  
./install_amp --force-version=2.1.1
```

(Replace 2.1.1 with the version you are upgrading from)

Installing the New Files

```
cd freepbx  
./install_amp
```

Keeping up to date with SVN

```
cd /usr/src/freepbx  
svn update  
./install_amp --force-version=2.1.1
```

(Or whatever the last released version was)

Recovering Lost Modules

This will let you use the asterisk@home modules not in freePBX and cure the "Unknown Module" problem. If you don't want the asterisk@home modules you can uninstall them later.

```
./AAH_updatemaint.sh
```

If you have any module errors after the upgrade.

After upgrade, many module statues change to unknow.

by [radiumfu](#), Tuesday 19 of September, 2006 [01:46:44 UTC]

After upgrade, many module statues change to unknow.

I did upgrade process follow upon two different ways, but have same result.

when I finish upgrade process, I open freePBX portal, it ask me "After upgrade, many module statues change to unknow." I click it. then only see part of module in Setup and Tools lable.

I compared with my original system, the update server lost below modules

[Setup](#)

1. Module Admin
2. Queues
3. Conferences
4. On Hold Music
5. System Recordings
6. Applications
7. DISA
8. Ring Groups

9. Time Conditions
10. Digital Receptionist

Tools

1. Backup & Restore
2. Asterisk Logs
3. Asterisk CLI
4. Java SSH

in the same time, in the "module Admin" link, I see 14 unknow modules.

My Asterisk 1.2.7.1 server based on CentOS with freePBX 2.0.1, and all this application are all installed by manu not A@H.

How can I find back these losted module? or if my update process have some mistake? or any other reason? please give me a hand.

Thank you!

Upgrade Install Doesnt Work Property

by [Atoning](#), Wednesday 31 of May, 2006 [17:15:04 UTC]

When upgrading on Asterisk at home you cannot connect to the Online Module Repository to re-install all your modules this has been reported a few times in various places. HELP!
